Rubber testing evaluates the processing and final properties of rubber, polymer, and elastomer materials. Across automotive, industrial, consumer, and construction applications, rubber is used in products that need to withstand deformation and maintain

their original shape. From durable tires to bouncing kickballs, rubber plays an important role in countless goods that benefit from its unique material properties. Rubber testing includes using rheometers, curemeters, and viscometers to optimize production and end-use properties. Rubber rheometers measure important characteristics such as minimum and maximum viscosity, scorch time, and conversion time. Curemeters measure curing profiles of rubber compounds under isothermal and non-isothermal test conditions at constant user-defined strain and frequency. Mooney Viscometers standard viscosity, scorch and stress relaxation testing of rubber polymers and compounds under isothermal test conditions.
