The global Rubidium Miniature Atomic Clock market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

An atomic clock is a clock that measures time by monitoring the resonant frequency of atoms. It is based on atoms having different energy levels. Electron states in an atom are associated with different energy levels, and in transitions between such states they interact with a very specific frequency of electromagnetic radiation.

The miniature rubidium atomic clock is a frequency standard with small size, low phase noise and wide temperature range. Rubidium atomic clocks are the simplest and most compact of all atomic clocks. The rubidium atomic clock is made of an atomic resonator and its associated control electronics. Inside the atomic resonator there is a rubidium vapour cell.
