The global Ruled Diffraction Gratings market size is predicted to grow from US\$ 155 million in 2025 to US\$ 203 million in 2031; it is expected to grow at a CAGR of 4.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Ruled diffraction gratings are optical devices used to disperse light into its component colors or wavelengths by means of diffraction. They are essential components in spectroscopy, where they are used to analyze the spectrum of light emitted or transmitted by a sample. Ruled diffraction gratings are a type of optical grating that consist of a surface with closely spaced parallel grooves or rulings.

The basic principle behind ruled diffraction gratings is based on the phenomenon of diffraction, where light waves encounter obstacles or slits that are on the order of the wavelength of light. When light passes through or reflects off the rulings on a grating, it undergoes constructive and destructive interference, resulting in the separation of different wavelengths of light into discrete orders or spectral lines.

Growing Demand in Research and Development: Ruled diffraction gratings are essential components in spectroscopic research and analysis, which is widely used in fields such as physics, chemistry, astronomy, and materials science.

Optical Instrumentation: Ruled diffraction gratings are used in a wide range of optical instruments, including spectrometers, monochromators, and laser systems, supporting

industries such as telecommunications, semiconductors, and optics.

Competition from Alternative Technologies: While ruled diffraction gratings are well-established, they face competition from other grating types like holographic and echelle gratings, which offer higher spectral resolution in some applications.
