The global Rumen Protected Choline market size is predicted to grow from US\$ 1100 million in 2025 to US\$ 1816 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

In 2025, global sales volume of rumen-protected choline reached 233,000 metric tons, with an average price of \$4,833 per ton.

Rumen-protected choline (RPC) is a feed additive created by physically or chemically protecting choline chloride using specific coating technologies such as hydrogenated vegetable oil, acrylic resin, ethyl cellulose, chitosan, or mixed wall materials to ensure stability within the ruminant rumen (requiring an effective bypass rate of over 80%) while allowing for release and absorption in the abomasum and small intestine. Choline is an essential nutrient for ruminants (especially high-yielding dairy cows), playing a vital role in fat metabolism, the maintenance of liver function, and neurotransmitter synthesis. However, standard choline chloride is rapidly degraded by rumen microorganisms (with a degradation rate exceeding 90%) and fails to reach the small intestine to exert its nutritional effects; thus, rumen-protection technology is the key to overcoming this bottleneck.

The raw materials for rumen-protected choline fall into two main categories: choline chloride and coating materials. Global production capacity for choline chloride is highly concentrated, with China accounting for over 80% of the total; major manufacturers include Shandong Hanwei, Binzhou Jujia, and Jiangsu Yinfeng. Production utilizes the ethylene oxide-trimethylamine synthesis method, with ethylene oxide, hydrochloric acid, and trimethylamine as raw materials; notably, the price of ethylene oxide is significantly influenced by petrochemical industry cycles. Regarding coating materials, hydrogenated

vegetable oil (primarily derived from Southeast Asian palm oil) is the dominant choice, offering relatively stable pricing. Choline chloride is highly hygroscopic, requiring production environments to maintain humidity levels below 30% and necessitating multi-layer coating to ensure stability; consequently, the coating process is more complex than that used for rumen-protected amino acid products.

The cost structure of rumen-protected choline is characterized by a significantly higher proportion of costs attributed to coating materials and processing compared to rumen-protected amino acids. Choline chloride raw material accounts for 40%-55% of the total cost (significantly lower than that of lysine and methionine due to choline's low molecular weight and high unit activity), while coating materials and processing costs account for 45%-60% (reflecting the high complexity of the coating process).
