## Abstracts

According to this study, the global Ruminant Enteric Methane Mitigation market size will reach US$ 145 million by 2031.

Ruminant enteric methane mitigation refers to strategies aimed at reducing the methane emissions produced during the digestive process of ruminant animals such as cows, sheep, and goats. Methane is generated in the animals' stomachs (specifically the rumen) as a byproduct of microbial fermentation when breaking down fibrous plant materials. Since methane is a potent greenhouse gas, mitigating these emissions is essential for addressing climate change. Common mitigation approaches include dietary changes (e.g., adding feed additives like seaweed or oils), selective breeding, improved pasture management, and the use of probiotics or vaccines to alter rumen microbial activity and reduce methane production.

United States market for Ruminant Enteric Methane Mitigation is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Ruminant Enteric Methane Mitigation is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Ruminant Enteric Methane Mitigation is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
