Runbook Automation (RBA) tools focus on designing and executing runbooks. Runbooks are documented procedures and scripts used to solve manual, repetitive, and predictable IT tasks. These tasks typically include system reboots, application deployments, routine maintenance, and troubleshooting. Instead of manually deploying these repetitive tasks, IT operations teams and system administrators can build steps and event triggers into reusable templates. When a service request is received, runbook automation software leverages these pre-built templates to perform these tasks without waiting for human intervention. Well-designed runbook automation processes help IT teams save time and resources on repetitive service requests and incident management. A tool similar to runbook automation is workload automation software. Runbook automation solves the problem of automating manual, repetitive tasks performed by IT administrators, while workload automation aims to orchestrate and automate comprehensive workflows and business processes. It excels at managing complex dependencies and interactions between various systems and applications. These two concepts work together to enhance the efficiency and reliability of IT operations, with each concept falling into a different area of ??the automation spectrum.

The global Runbook Automation Software market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
