The global Runoff Water Hydrocarbon Separator market size is predicted to grow from US\$ 146 million in 2025 to US\$ 234 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

A runoff water hydrocarbon separator is a device specially designed to separate and remove hydrocarbons (such as oil, diesel, gasoline, lubricants, etc.) from water. It uses the density difference between hydrocarbons and water, combined with gravity sedimentation, coalescence separation or adsorption technology to separate oil pollutants and prevent them from entering sewers or natural water bodies, thereby reducing the risk of environmental pollution. This equipment is usually equipped with multiple compartments, filter units or adsorption media to improve separation efficiency. Runoff water hydrocarbon separators are widely used in places such as oil refineries, gas stations, industrial emission treatment facilities, and airports. They are particularly suitable for the treatment of oily wastewater and rainwater runoff to ensure that the discharged water quality meets environmental regulations. In 2025, global Runoff Water Hydrocarbon Separator production reached approximately 18620 units, with an average global market price of around 8000 USD/unit. The production capacity for Runoff Water Hydrocarbon Separator in 2025 was approximately 20000 units. The typical gross profit margin for Runoff Water Hydrocarbon Separator between 20% and 40%.

The Runoff Water Hydrocarbon Separator market is driven by increasing environmental regulations, growing industrialization, and rising awareness of water pollution control. Demand is particularly strong in sectors such as oil & gas, transportation infrastructure, and urban construction. Technological advancements, including improved coalescing materials and compact system designs, are enhancing separation efficiency and expanding application scenarios. However, market growth may be influenced by

installation costs and varying regulatory standards across regions.
