Container runtime solutions enable container usage by providing APIs and abstracting technical components. They facilitate the execution of container lifecycle commands against each container instance. Runtime environments couple the configuration files with the actual files that are necessary to execute the application. Companies use these tools to launch applications and manage the container application lifecycles. With container runtimes specifications, companies can specify how file systems are unpacked, built, and configured. They allow developers to reduce system overhead, share resources, and enforce access capabilities.

The global Runtime Software market size is projected to grow from US\$ 517.5 million in 2023 to US\$ 1117 million in 2030; it is expected to grow at a CAGR of 11.6% from 2024 to 2030.
