The global Rust Removal Robot for Ship market size is predicted to grow from US\$ 86.67 million in 2025 to US\$ 239 million in 2032; it is expected to grow at a CAGR of 15.9% from 2026 to 2032.

Rust removal robot for ship is an automated equipment specially designed for rust removal on the surface of ships. Traditional ship rust removal operations mainly rely on manual labor, which is not only inefficient, but also has safety hazards and environmental pollution problems. With the advancement of science and technology, ship rust removal robots have emerged. They can complete rust removal tasks efficiently and safely while reducing the impact on the environment.

With the continuous maturity of ship rust removal robot technology and the expansion of its application scope, its market prospects are becoming more and more broad. In the future, ship rust removal robots will develop in a more intelligent, efficient and environmentally friendly direction. For example, by integrating AI algorithms and sensor technology, robots will be able to perceive the operating environment in real time and autonomously adjust operating parameters to achieve more accurate rust removal effects. At the same time, with the continuous development of new energy and environmental protection technologies, ship rust removal robots will also pay more attention to energy conservation, emission reduction and the improvement of environmental protection performance.

Ships sail in the ocean, especially below the waterline, and are subject to alternating hot and cold, seawater erosion, salt spray evaporation, sea waves, algae and marine organisms, etc., which are prone to corrosion and rust. After the metal materials in the ship are corroded, they will deteriorate in appearance, color and mechanical properties,

causing serious damage to the hull. Therefore, ship rust removal has become an indispensable part of ship maintenance.

With the continuous growth of global trade and the rapid development of the shipbuilding industry, the number of ships is increasing, and the demand for ship rust removal is also increasing. Traditional manual rust removal methods have problems such as low efficiency, high labor intensity and high safety risks. Therefore, the market has an urgent need for efficient, safe and environmentally friendly ship rust removal robots.

The rapid development of robotics, sensor technology, artificial intelligence and other technologies has provided strong support for the research and development of ship rust removal robots. The application of these technologies enables ship rust removal robots to identify rust more accurately, remove rust more efficiently, and have stronger autonomous navigation and obstacle avoidance capabilities.

The mature application of high-pressure water jet technology enables ship rust removal robots to complete rust removal tasks with higher efficiency and quality. At the same time, the application of wastewater recovery and filtration system also solves the problem of wastewater and waste residue discharge generated during the rust removal process, achieving environmentally friendly rust removal.
