S7 nuclease is an endonuclease enzyme derived from the bacterium *Bacillus stearothermophilus*, which is characterized by its ability to cleave single-stranded DNA and RNA molecules. It recognizes and digests nucleic acids at specific sequences, including the sequence GGCCG, leading to the generation of smaller nucleotide fragments. S7 nuclease is particularly useful in the analysis of RNA-DNA hybrids and the characterization of RNA secondary structures. In the context of molecular biology and biotechnology, S7 nuclease finds applications in RNA-DNA hybrid cleavage assays, footprinting studies, and the analysis of RNA structure-function relationships.

The global S7 Nuclease market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
