The Sacrificial Anode Cathodic Protection System (SACP) is a method used to protect metal structures, such as pipelines, ships, and storage tanks, from corrosion. Corrosion occurs when metal reacts with its environment, typically oxygen and moisture, causing it to degrade over time. In an SACP system, a more reactive metal (the sacrificial anode) is connected to the metal structure that needs protection. This sacrificial anode corrodes instead of the protected metal, essentially sacrificing itself to protect the structure from corrosion. The sacrificial anode is usually made of a metal like zinc, aluminum, or magnesium, which corrodes more easily than the metal it is protecting.

The global Sacrificial Anode Cathodic Protection System(SACP) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
