Safety Winged Infusion Sets are sterile, single-use medical devices designed for intravenous (IV) infusion procedures. These sets consist of a winged (butterfly) needle with flexible plastic wings that facilitate precise insertion into the vein. Attached to the needle is a length of flexible tubing, which connects to an IV line, catheter, or infusion pump, enabling the continuous delivery of fluids, medications, or nutrients. The defining feature of safety winged infusion sets is their integrated safety mechanism, which automatically or manually activates to shield the needle after use, reducing the risk of accidental needlestick injuries. These sets are particularly beneficial for short-term or intermittent IV access in patients, offering enhanced comfort and stability compared to traditional straight needles. They are often used in pediatric, geriatric, and outpatient settings due to their precision and ease of use for venipuncture.
