A saliva ejector is a device, often used by dentists, which generally consists of a suction tube and a disposable tip. It is typically inserted into a patient's mouth to remove saliva as well as blood and other waste materials. Usually made of plastic, the device can include a flexible wire to bend it into a hook shape so that it can be inserted comfortably. Sometimes the saliva ejector is used for brief periods of time, or it can be left in place during a procedure such as a dental cleaning, tooth filling, or a root canal, for example.
