A Salt Bath Furnace is a device for the heating or cooling of work by immersing it in a liquid consisting of fused salts of the proper composition for the purpose intended. The salts may be heated by electrical or gas-fired means. The operating principle of the electrode type salt bath furnace is to generate heat directly in the salt by utilizing its resistance to the passage of current. Salts, while insulators in the solid state, are excellent resistors in the fused state. Potential is applied to the molten salt with the use of heavy metal bars called electrodes that are connected to the secondary of special multiple voltage air cooled transformers. These electrodes are located and spaced in such a way to facilitate electrodynamic circulation whenever energized, providing a powerful pump to help aid temperature uniformity throughout the bath.
