Salt-based water softeners are equipped with polymer resin beds. This is what attracts hard water minerals and replaces them with sodium ions. It is this removal of magnesium (Mg^{2+}) and calcium (Ca^{2+}) is what is known as “water softening.” A process known as backwashing involves the filtering of the water.

The resin bed comes to play again during a phase known as ‘regeneration.’ When sodium is introduced into the softening system, the displacement of calcium and magnesium is initiated. These hard water minerals now trapped in the resin bed are replaced by positively charged sodium ions.
