The global Salvage Rewinders market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The salvage rewinder has been designed to rectify rolls with alignment defects; its main features include: Possibility of inspection. Rewinding through bidirectional system in order to recover the roll to the original condition.

Differential Roll Coaters are a type of roll coating machine that use two rollers with different speeds and directions to apply a coating material onto a substrate. The differential roll coater consists of an application roller, a doctor roller, a scraper blade, a fluid pump, a conveyor, and a control system. The application roller rotates in the same direction as the substrate and transfers the coating material onto it. The doctor roller rotates in the opposite direction and removes the excess coating material from the application roller. The scraper blade collects the excess coating material and returns it to the fluid pump. The conveyor moves the substrate through the machine. The control system adjusts the speed, pressure, and gap of the rollers, as well as the flow rate and viscosity of the coating material. Differential Roll Coaters can apply various types of coatings such as water-based, solvent-based, UV-curable, oil-based, and others onto different substrates such as wood, metal, plastic, and others. The industry trend of Differential Roll Coaters is expected to show a positive growth in the global market, as they are more efficient, accurate, and flexible than other types of coating machines.
