A sand and gravel spreader is a piece of construction equipment used to evenly distribute aggregate materials such as sand, gravel, and rock onto a surface. These machines are commonly used in road construction, landscaping, and other outdoor projects where even distribution of materials is important. The spreader typically consists of a hopper where the material is loaded, a conveyor belt or auger that distributes the material, and a set of wheels or tracks that move the machine forward. Some spreaders may also have a leveling blade or roller attachment to further smooth out the surface.

There are several different types of sand and gravel spreaders that are commonly used in construction and landscaping projects.

Mounted type spreaders are typically attached to a larger piece of equipment such as a tractor or truck. They use a hydraulic or mechanical system to spread the material onto the ground.

Self-propelled spreaders are similar to mounted types, but they are able to move themselves without the need for a separate vehicle. These machines are commonly used in smaller projects where a larger machine may not be necessary.

Pull type spreaders are towed behind a vehicle such as a tractor or ATV. These spreaders are often more affordable and easier to operate than mounted or self-propelled options.

All of these types of spreaders are designed to evenly distribute sand, gravel, and other aggregate materials onto a surface, making them an essential tool for a variety of construction and landscaping projects.
