A space heater is a type of heater that transfers heat to objects without direct contact. Unlike conventional heating methods, space heaters don't require physical contact with the object being heated, allowing for efficient and even heating. They are designed to transfer most of the heat energy directly to the object, minimizing energy loss. Additionally, because there's no direct contact, the risk of fire or burns due to heat is reduced.

However, it's worth noting that space heaters can be more expensive than traditional heating methods. Implementing the necessary equipment and technology can also be costly, and the applicability of space heaters depends on the underlying principle.
