A sapphire wafer carrier is a precision-engineered support substrate made from synthetic single-crystal sapphire (Al?O?), designed to hold and protect delicate semiconductor wafers—such as GaAs, InP, or ultra-thin silicon—during various fabrication processes. Known for its exceptional hardness, chemical inertness, thermal stability, and optical transparency, sapphire provides a robust and clean platform that resists warping or degradation under high-temperature or corrosive processing conditions. These carriers often include multiple holes or custom shapes to accommodate alignment, vacuum chucking, or backside processing, and they are manufactured to tight tolerances in terms of flatness, parallelism, and surface finish. Widely used in compound semiconductor production, MEMS, LED manufacturing, and wafer thinning applications, sapphire wafer carriers are critical to ensuring dimensional stability and product integrity throughout high-precision, high-yield semiconductor manufacturing workflows.
