The report requires updating with new data and is sent in 48 hours after order is placed.

Satellites with Synthetic Aperture Radar (SAR) orbit the Earth in a sun-synchronous LEO polar orbit and data acquisitions can be made at any time of day or night and independent of cloud coverage, collecting both amplitude and phase data. The SAR satellites have repeating paths which, using two phase datasets for the same location at different times, allows for interferometric SAR (InSAR) showing relative ground displacements between the two datasets along the direction of the radar beam.
