Satellite Antenna is a device used to receive and transmit satellite signals, commonly used for satellite communications and broadcast reception. These antennas are usually made of metal and have a reflective surface (parabolic dish) that is used to focus microwave signals from or send signals to the satellite. Its working principle is to use the reflection characteristics of paraboloids to focus the microwave signals from the satellite onto the receiver, or to concentrate the signals from the transmitter to the satellite.

Satellite Antenna is generally divided into two types: receiving antenna and transmitting antenna. The receiving antenna is used to receive signals transmitted by satellites, such as television signals, Internet data, etc.; while the transmitting antenna is used to send signals to satellites, such as satellite phones, satellite Internet, etc.

The size and shape of the Satellite Antenna will vary depending on its use and environment. Some antennas used for home satellite television reception may be relatively small, while antennas used for large ground stations or mobile communications stations may be very large.

The global Satellite Antenna market size is projected to grow from US\$ 3208 million in 2024 to US\$ 6668 million in 2030; it is expected to grow at a CAGR of 13.0% from 2024 to 2030.
