The global Satellite Dual-mode Mobile Phone market size is predicted to grow from US$ 750 million in 2025 to US$ 1072 million in 2031; it is expected to grow at a CAGR of 6.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Satellite dual-mode mobile phones refer to smartphones that support two different network modes (such as ground cellular networks and satellite networks) and can communicate via satellite. It breaks the limitation of traditional mobile phones relying on ground base station communications. In remote areas, areas with insufficient signal coverage or when the ground network is paralyzed, satellite signals can be used to ensure the stability and timeliness of communications. At present, dual-mode terminal access has entered the commercial application stage, and the mobile phone direct connection function based on dual-mode terminal access is rapidly popularizing in mid-to-high-end models. However, this route relies on the non-standardized technical system unique to each satellite operator, which is not conducive to global ubiquitous interconnection. In addition, the current communication capabilities are mainly limited to voice and low-speed data services, and broadband data services are not supported for the time being (the current typical communication rate is 0.8~2.4kbit/s).

United States market for Satellite Dual-mode Mobile Phone is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
