Satellite locators, also known as satellite tracking devices or satellite trackers, are devices that use Global Navigation Satellite System (GNSS) technology to determine the location and movement of objects on the Earth's surface. These devices typically use satellite constellations, such as GPS, GLONASS, or Galileo, to accurately determine the position, speed, and heading of the object being tracked.

Satellite locators are commonly used in a variety of applications, including vehicle and asset tracking, wildlife monitoring, and search and rescue operations. They can be used to track the location and movement of vehicles, such as cars, trucks, and boats, as well as stationary assets, such as containers and equipment.

The devices typically consist of a receiver that receives signals from the satellite constellations and a processor that calculates the location and other information based on the received signals. The information is then transmitted to a central server or displayed on a screen in real-time, allowing users to monitor the location and movement of the tracked object.

Satellite locators are becoming increasingly popular due to their accuracy and reliability, and are often used in industries such as logistics, transportation, and agriculture, where real-time tracking of vehicles and assets is essential for effective management and optimization.
