The global Saturation Diving System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Saturation Diving System is an advanced diving system specially designed for deep sea diving operations. Compared with traditional free diving, saturation diving systems allow divers to stay in deep water for longer periods of time, providing a safer and more efficient operating environment.

During saturation diving operations, divers are placed in a high-pressure environment, usually through the air pressure of a diving chamber to simulate a deep water environment. This allows divers to work for longer periods of time as their body tissues absorb and release nitrogen, reducing the need for post-dive decompression. In this way, divers can conduct deep-sea operations for longer periods of time, improving efficiency and operation quality.

Saturation diving systems are widely used in deep-sea oil field development, subsea maintenance, scientific research and other fields that require long-term operations in deep water. It provides divers with a relatively safe and comfortable working environment and greatly expands the capabilities and scope of deep-water operations.
