The scalp cooling cap used for hair loss after chemotherapy is a computer-controlled system, which is divided into internal and external layers. The inner layer has liquid circulation to play a cooling role, and the outer layer is made of neoprene insulation to maintain the cooling effect. The working principle of the cooling cap is to cool the scalp and make the scalp blood vessels contract, so as to reduce the absorption of chemotherapy drugs by hair follicle cells, reduce the activity of hair follicles, slow down cell division, and finally achieve the purpose of reducing hair loss.
