## Abstracts

The global Scanning Laser Gas Detector market size is predicted to grow from US\$ 83.67 million in 2025 to US\$ 123 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

A scanning laser methane detector is a device that utilizes laser technology to detect methane gas concentrations in the air, widely used in natural gas pipelines, industrial sites, and environmental monitoring. The device emits a laser beam at a specific wavelength and measures the absorption by methane to quickly and accurately identify the location and concentration of methane leaks. The scanning design allows the detector to cover large monitoring areas, offering non-contact, remote detection with high sensitivity, real-time performance, and safety advantages, effectively preventing the environmental and safety risks associated with methane leaks.

In 2024, global Scanning Laser Gas Detector sales reached 3,123 K Units, with an average global market price of around 25.5 USD/Unit. Production capacity reached 4,500 K Units, with a gross profit margin of approximately 50%.

## Market Trends

With the advancement of the global 'dual carbon' strategy, the aging of natural gas and city gas infrastructure, and the increasing intensity of environmental regulations, demand for methane and other greenhouse gas leakage monitoring has increased significantly across various industries. This type of equipment has been widely used in scenarios such as city gas pipeline inspection, oil and gas production and storage, coal mine ventilation safety monitoring, and landfill and biogas facility management. At the same time, with the growing trend toward unmanned operations and digitalization,

scanning laser methane detectors are increasingly being integrated with unmanned aerial vehicles (UAVs), fixed stations, and IoT platforms to form complete intelligent monitoring systems, enabling remote data transmission, automatic early warning, and risk analysis.

### Market Disadvantages

Key components such as semiconductor lasers, optical lenses, photodetectors, and high-precision control chips are primarily controlled by European, American, and Japanese manufacturers. Domestic companies still lag behind in stability, lifespan, and precision control, resulting in high production costs and limited gross profit margins. Currently, the main customers are concentrated in the energy, chemical, and municipal gas industries. Other potential areas, such as agricultural methane emissions and environmental science research, have yet to see large-scale application. Due to the high price of the equipment (typically priced between 200,000 and 800,000 RMB per unit), some small and medium-sized gas companies and local governments are unable to purchase them on a large scale.

### Market Outlook

With the deep integration of AI algorithms, cloud computing, and the Internet of Things (IoT), equipment will transform from 'single-point detection' to a 'multi-dimensional intelligent monitoring network,' supporting multi-source data analysis, automatic leak location, and methane emission trend modeling. In the future, equipment will be smaller, more modular, and more integrated, allowing for easy installation on drones, fixed towers, or mobile inspection vehicles, enabling 24/7 automated inspections and remote maintenance. The market structure will also gradually shift from being dominated by high-end imports to a rise in domestic brands. Breakthroughs by domestic companies in laser packaging, spectral algorithm optimization, and data system development will significantly reduce costs, improve maintainability, and promote the widespread application of these products in gas pipeline networks in small and medium-sized cities, industrial parks, and scientific research institutions.
