A scissor screw jack is a device that can lift a vehicle or other heavy object by applying a small amount of force. It consists of four metal strips, which are connected by hinges to form a diamond shape. A thread passes through the center of the diamond and is connected to the crank handle at one end. By rotating the handle, the thread moves up or down, causing the diamond to expand or contract. This will change the height of the jack and raise or lower the object placed on top of the jack. The scissor type screw jack is simple, compact, and easy to use. They are often found in the trunk of cars as emergency tools for changing tires. However, they also have some limitations, such as low lifting capacity, limited lifting range, and instability on uneven surfaces. Therefore, they are not suitable for heavy or frequent use.
