The global SCR Denitration Catalyst market size is predicted to grow from US\$ 1626 million in 2025 to US\$ 1817 million in 2031; it is expected to grow at a CAGR of 1.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

SCR Denitration Catalyst is a type of catalyst that can reduce nitrogen oxides (NO_x) emissions from flue gas by selective catalytic reduction (SCR) with ammonia or urea as the reducing agent. SCR Denitration Catalyst is composed of a carrier material, such as titanium dioxide (TiO₂), and an active component, such as vanadium (V), tungsten (W), or molybdenum (Mo). The catalyst can be shaped into different forms, such as honeycomb, plate, or corrugated. The catalyst can effectively remove NO_x from various sources, such as coal-fired power plants, cement plants, steel plants, waste incinerators, and diesel engines.

The major factors driving the market growth include the increasing demand for clean energy and the stringent environmental regulations that limit NO_x emissions from various industries and vehicles. The technological innovations and developments in SCR Denitration Catalyst products and applications are also expected to boost the market growth. However, some of the challenges that may hinder the market growth are the high cost and complexity of SCR Denitration Catalyst products; the competition from alternative NO_x reduction technologies, such as low-NO_x burners or non-thermal plasma; and the potential health and environmental risks associated with SCR Denitration Catalyst products.
