A Scraper Bridge for Settlement Tank is a vital mechanical structure used in water and wastewater treatment facilities to enhance the efficiency of sedimentation processes. It is typically a horizontal bridge that spans across the diameter of a circular or the length of a rectangular settlement tank, supporting scraper blades or rakes attached underneath. These scraper blades continuously move slowly along the tank floor, collecting and directing settled sludge and suspended solids toward a central sludge hopper or removal point. By systematically removing accumulated solids from the bottom of the tank, the scraper bridge helps prevent sludge buildup, maintain the clarity of the supernatant water, and ensure consistent operation of the sedimentation process. The scraper bridge is powered by a motorized drive mechanism that controls its rotational or reciprocating motion, depending on the tank design, making it an essential component for effective solid-liquid separation in municipal and industrial water treatment plants.

United States market for Scraper Bridge for Settlement Tank is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
