The global Screen-Printable Conductive Silver Paste market size is predicted to grow from US$ 818 million in 2025 to US$ 1306 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

Screen-printable conductive silver paste is a viscous functional paste composed of high-purity ultra-fine silver powder, thermoplastic or thermosetting resins, organic solvents, and additives, produced through precise dispersion processes. The paste is applied onto substrates via screen printing to form designed conductive circuit patterns. After low-temperature curing (typically 120–180°C) or UV curing, it forms conductive coatings with excellent electrical conductivity, adhesion, and environmental resistance. Its core performance depends on the synergistic optimization of silver powder morphology (flake, spherical, etc.) and particle size gradation, resin systems, and solvent formulations. This product is widely used in touch panels, membrane switches, flexible circuits, RFID antennas, photovoltaic cell electrodes, smart windows, and printed sensors. In 2025, global sales of Screen-Printable Conductive Silver Paste reached approximately 1,520 metric tons, with an average price of around USD 550 per kilogram (equivalent to USD 550,000 per metric ton). Single production line capacity typically ranges from 50 to 200 metric tons per year, with industry gross margins generally ranging from 25% to 35%.
