Abstracts

The global Scroll Two-Stage Compressor market size is predicted to grow from US$ 1766 million in 2025 to US$ 2225 million in 2032; it is expected to grow at a CAGR of 3.4% from 2026 to 2032.

In 2024, global Scroll Two-Stage Compressor production reached approximately 5,300 k units?with an average global market price of around US$ 330 per unit, a single-line production capacity of approximately 5,000 units/year, and a gross profit margin of approximately 10%-30%. Scroll Two-Stage Compressor is a type of positive displacement compressor that achieves high pressure ratios and improved energy efficiency through a dual-stage scroll compression mechanism within a single housing. Its core feature is the use of two serially arranged scroll stages or an intermediate injection (economizer) system, where the low-pressure refrigerant gas is first partially compressed in the low-pressure stage, then either cooled or injected at an intermediate pressure before entering the high-pressure stage for final compression. This process reduces discharge temperature, increases volumetric efficiency, and allows stable operation under high pressure ratios. Upstream primarily consists of the production and supply of key raw materials and components, including high-precision steel, copper tubing, electrical motors, bearings, and advanced polymers, which are critical for ensuring compressor durability, efficiency, and reliability. Midstream involves the design, manufacturing, and assembly of the scroll two-stage compressors themselves, dual-stage compression, and inverter-driven motors to optimize energy efficiency and performance across different operating conditions. Downstream covers the distribution and application of these compressors in various HVAC and refrigeration systems, including air-source heat pumps, VRF systems, commercial and residential air conditioning units, and low-temperature refrigeration solutions.
