Sea lice management solutions are crucial for the sustainable health of aquaculture, especially in salmon farming. These solutions aim to control the population of sea lice, small parasitic crustaceans that can cause significant harm to fish, including reduced growth, skin lesions, and increased susceptibility to other diseases. They can be categorized into several types. Medicinal solutions involve in - feed chemotherapeutants, bath treatments with drugs like hydrogen peroxide, and the development of vaccines to boost fish immunity. Non - medicinal approaches are diverse. Physical removal methods such as hydrolicers, thermolicers, and lasers use water jets, temperature changes, and laser pulses respectively to eliminate sea lice. Biological control relies on cleaner fish like ballan wrasse and lumpfish that eat sea lice, and sea lice traps to draw them away. Environmental management includes sea lice skirts, snorkels, and deep - water feeding/lights strategies to keep fish away from lice - infested areas. Monitoring and management solutions use smart sensors and data analysis to predict and respond to sea lice outbreaks. Each application, whether in salmon farming, open - ocean aquaculture, coastal fish farms, or cage - free systems, requires a tailored combination of these solutions to effectively manage sea lice and protect the well - being of farmed fish.
