Sea rescue transmitter is a specialized device designed to enhance maritime safety by transmitting distress signals and location information in the event of an emergency or a search and rescue situation. This transmitter is typically used by individuals, vessels, or aircraft to alert authorities and nearby responders to their need for assistance.

The sea rescue transmitter often incorporates technologies such as Global Maritime Distress and Safety System (GMDSS) compatibility, GPS, and satellite communication capabilities. In case of an emergency, users can activate the transmitter, which sends out distress signals to designated rescue coordination centers or satellites. These

signals provide crucial information about the distressed party's identity, location, and the nature of the emergency, enabling rapid and accurate response by search and rescue teams.

Sea rescue transmitters are essential tools for improving survival rates and expediting rescue operations in the maritime environment, particularly in situations where communication might be limited, such as in remote or open water areas.

In summary, a 'shore power sensor' monitors electrical connections between vessels and the shore, while a 'sea rescue transmitter' sends distress signals and location information during maritime emergencies.
