The subfloor junction box is an important hub for subsea power transformation and information concentration. On the one hand, it is used to realize the function of power conversion and distribution, and the high-voltage power transmitted by the shore base station is transformed and transmitted to various observation instruments on the seabed. On the other hand, it can centrally process and dispatch the signals of observation instruments, and transmit massive data to shore base stations in real time. The subfloor junction box mainly consists of three functional modules, one is the power

conversion and distribution module, the other is the signal processing, storage and communication module, and the third is the observation equipment socket module, which are generally sealed and pressure-resistant cavity. The junction box consists of a high-voltage to medium-voltage power cavity, a medium-voltage to low-voltage power cavity, a control cavity, and a photoelectric separation cavity. The subfloor junction box mainly has relay functions, data communication functions, control command transmission functions, power conversion and distribution functions, management functions, interface specification conversion functions, self-maintenance functions, and signal self-storage functions.
