The global Seafood Microbiological Detection market size is predicted to grow from US\$ 49.14 million in 2025 to US\$ 65.24 million in 2032; it is expected to grow at a CAGR of 4.2% from 2026 to 2032.

The early detection methods of seafood include manually collecting the samples and testing in laboratories, which was time-consuming and led to various human errors. However, present-time development in microbiology detection of seafood reduced errors, as sample collection and detection methods became automated, which reduced the need for human intervention. This includes the usage of point-of-care testing tools at the seafood production site that reduce the chances of spoilage during and after transportation. Moreover, the market for seafood microbiological detection holds positive, as the emergence of data analytics and automated tools eliminates human intervention and provides detailed analysis of bacteria, their future effects, and outbreaks on individuals. Moreover, rising trends in sustainable aquaculture have led to the adoption of environment-friendly production and manufacturing of seafood in the market.

United States market for Seafood Microbiological Detection is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
