The global Seamless Compression Garments market size is predicted to grow from US\$ 414 million in 2025 to US\$ 676 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

In 2025, global Seamless Compression Garments production reached approximately 16.42 M units, with an average global market price of around US\$ 25.7 per unit.

Seamless compression garments are a type of functional clothing that uses seamless knitting technology to create a one-piece design, combining elasticity and gradient pressure. The core of these garments lies in their special weaving techniques and precise ratios of elastic fibers (such as spandex and Lycra) to apply controllable gradient pressure to specific areas of the body. This promotes blood circulation, relieves muscle fatigue, supports joint stability, and shapes and firms the body. They eliminate the seams of traditional clothing, offering a close-fitting yet unrestricted fit, breathability, sweat-wicking properties, and resistance to stretching and deformation. They are widely used in sports and fitness, medical rehabilitation, and everyday body shaping.

3D seamless knitting and one-piece molding technologies continue to upgrade, enabling ?body map-like? zoned gradient pressure design. This provides precise support and pressure regulation for different muscle groups, joints, or venous return pathways, significantly improving fit and wearing comfort. On the materials side, environmentally friendly materials such as bio-based elastic fibers and biodegradable spandex are accelerating the replacement of traditional synthetic fibers, while integrating composite functions such as moisture wicking, antibacterial deodorization, and temperature control, balancing functionality and sustainability. Smart integration is becoming a new growth point. Flexible sensors and micro-monitoring modules are embedded in clothing

to collect real-time data such as heart rate, muscle fatigue, and blood circulation status, adapting to professional scenarios such as sports training optimization and post-operative rehabilitation monitoring, driving the transformation of products from 'passive protection' to 'active intervention.' Furthermore, customized services are emerging, relying on digital scanning and flexible production to provide exclusive solutions for people with different body types, sports types, or medical needs, breaking the limitations of standardized products.
