The global Seawater Cooling System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A seawater cooling system is an alternative cooling technology that utilizes cold seawater as a natural coolant. Here's a breakdown of its function:

Heat Exchanger: Seawater is pumped through a heat exchanger, where it absorbs heat from a closed-loop freshwater system. This freshwater loop circulates through the equipment or building requiring cooling.

Temperature Regulation: The cool seawater lowers the temperature of the freshwater in the closed loop.

Chilled Water Distribution: The chilled freshwater is then distributed to the target area for air conditioning or industrial process cooling.

Seawater Discharge: After absorbing heat, the warmed seawater is discharged back into the ocean.

United States market for Seawater Cooling System is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
