Seawater filtration devices are used to desalinate seawater by desalinating the sodium chloride contained in seawater through filtration.

Desalination of seawater has been practiced for a long time, but in many cases, seawater was treated by evaporation, which required enormous energy and cost. The development of seawater filtration devices, however, has completely changed the situation.

Seawater filtration devices use reverse osmosis membranes in a system based on the principle of osmotic pressure to perform desalination. The system has already been introduced in countries with scarce water resources, such as the Middle East and Africa.

The global Seawater Filtration Device market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
