Seawater reverse osmosis (RO) membrane is a reverse osmosis membrane used for seawater desalination. Desalination is the process of converting salty seawater into fresh water that can be used for drinking, agricultural irrigation, and industrial purposes. In seawater desalination, reverse osmosis technology is a common method in which seawater is forced through a reverse osmosis membrane through pressure, thereby isolating salt and other impurities to obtain fresh water. Seawater RO membrane is a reverse osmosis membrane specially designed to handle high-salinity seawater. Compared with traditional freshwater RO membranes, seawater RO membranes need to have higher salt barrier properties in order to effectively remove salt, microorganisms and other pollutants in seawater while maintaining high water flux.

The global Seawater Reverse Osmosis RO Membrane market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
