A secondary particle detector is a device used in particle physics and nuclear physics experiments to detect secondary particles generated by particle interactions. When a particle beam or ion beam interacts with a target material, secondary particles may be generated, which carry important information about the original particles or the interaction process. The main task of a secondary particle detector is to capture, measure and analyze these secondary particles, so as to infer the properties, energy, momentum and other physical quantities of the original particles, or to understand the transport and interaction processes of particles in the target material.

The global Secondary Particle Detector market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
