Secondary-side ICs (integrated circuits) refer to a type of electronic component used in power supply applications. These ICs are typically located on the secondary side of a power supply circuit and are responsible for controlling the power delivered to the load.

Secondary-side ICs can include a range of functions, such as voltage regulation, current sensing, and feedback control. They are designed to work in conjunction with primary-side ICs, which are located on the primary side of the power supply circuit and are responsible for converting the AC input voltage to a regulated DC output voltage.

In general, secondary-side ICs are used in switch-mode power supplies, which are widely used in a range of applications, including computers, consumer electronics, and industrial equipment. These ICs play a critical role in ensuring that power is delivered safely and efficiently to the load, and they are a key component in modern power supply designs.
