Risk-based authentication (RBA) solutions are identity management products that weigh user variables to determine and identify threats. Companies use RBA software to increase the effectiveness of user governance and authentication procedures. Users who are determined to be riskier are required to provide additional authentication information. These analyze IP addresses, devices, behaviors and identities to set customized authentication methods for each individual user attempting to access the network. Non-suspicious users accessing applications from known devices, locations, and networks may be automatically signed in. Suspicious users may be required to prompted to provide SMS code, biometric verification, or email confirmation actions to properly verify their identity.
