An earthquake is a natural disaster that produces massive ground shaking that can cause the collapse, damage, or instability of buildings and equipment. Seismic Building Protection Systems are designed to reduce the impact of earthquake-induced vibrations on buildings and equipment by using a variety of techniques and devices to secure or restrain buildings and equipment in their place. These systems typically include components such as isolators, dampers, and support systems. The design and installation of Seismic Restraint Systems needs to be based on the seismic activity level of the seismic area, the characteristics of the building and equipment, and the corresponding design guidelines and standards. Its purpose is to protect personnel's lives, reduce property losses, and ensure that buildings and equipment have sufficient seismic resistance in earthquakes.

The global Seismic Building Protection Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
