The global Seismic Dampers in Buildings market size is predicted to grow from US\$ 1674 million in 2025 to US\$ 2183 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

Seismic Dampers are used in damping the oscillations of a building during an earthquake. There are many types of dampers for buildings, and damping through friction tends to be one of the most efficient methods of dissipating seismic energy. The friction damper operates by dissipating kinetic energy through friction. The Dampers allow the building to move elastically and dissipate the energy of the earthquake. This, in turn, produces substantial savings as structural elements can be optimized for cost savings.

The seismic dampers in buildings market is driven by the need for increased building safety and resilience against earthquakes. As governments, engineers, and building owners emphasize the importance of earthquake-resistant structures, the market is expected to experience growth, innovation, and wider adoption of seismic dampers in both new construction and retrofitting projects.
