The global Seismic Elastomeric Face Seal System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Seismic elastomeric face seal system is a type of sealing arrangement used in construction or infrastructure projects to accommodate movement or vibration induced by seismic activities. It typically consists of elastomeric materials, such as rubber or synthetic compounds, strategically placed between two structural elements to provide flexibility and absorb seismic forces. This system helps reduce the transmission of vibrations and minimizes the potential for damage or failure in structures during earthquakes or other seismic events. The elastomeric face seal acts as a buffer, allowing controlled movement and absorbing energy to protect the integrity of the structure.
