This report studies the seismic isolation system market. Seismic isolation system is the system used to reduce the effects of earthquake ground shaking on structure, their components and protect them from damaging. The system decouples the building or structure from the horizontal components of the ground motion by interposing structural elements with low horizontal stiffness between the structure and the foundation. This gives the structure a fundamental frequency that is much lower than both its fixed-base frequency and the predominant frequencies of the ground motion.

The global Seismic Isolation System market size is projected to grow from US\$ 462 million in 2024 to US\$ 579 million in 2030; it is expected to grow at a CAGR of 3.8% from 2024 to 2030.
