Seismic joint is a specialized joint used in construction or infrastructure projects to accommodate the movement or displacement caused by seismic activities. It is primarily designed to absorb horizontal, vertical, and rotational motions, ensuring that adjacent structural elements can move independently without causing damage or structural failure. Seismic joints are commonly used in buildings, bridges, and other large-scale structures in earthquake-prone areas. They are typically made from flexible materials, such as elastomers or metal alloys, and are engineered to withstand significant seismic forces while maintaining the overall integrity and safety of the structure.
