## Abstracts

The global Selective Catalytic Reduction Technology market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Selective catalytic reduction technology is currently the most widely used flue gas denitration technology in the world. It uses reducing agents (such as NH3, urea, etc.) under the action of a catalyst to react preferentially and selectively with NOx in the flue gas, reducing it to nitrogen and water, thereby achieving the purpose of denitrification.

SCR technology has many advantages such as high denitrification efficiency, good product selectivity, and wide application range. Its maximum denitrification efficiency can reach more than 90%, and the products are nitrogen and water, with no by-products and no secondary pollution. In addition, the SCR technology device has a simple structure, reliable operation, and easy maintenance, so it has broad application prospects in the field of flue gas denitration.

The key to SCR technology is to control the escape rate of NH3 and the conversion rate of SO2 while ensuring the denitrification efficiency to ensure the safe and stable operation of the SCR system. In practical applications, it is necessary to select appropriate catalysts and reducing agents based on key parameters such as specific flue gas composition and dust content to achieve the best denitrification effect.

United States market for Selective Catalytic Reduction Technology is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
