The global Self-cleaning Centrifuge market size is predicted to grow from US$ 3546 million in 2025 to US$ 4851 million in 2031; it is expected to grow at a CAGR of 5.4% from 2025 to 2031.

The working principle of the self-cleaning centrifuge is to use the centrifugal force generated by rotation to separate different substances in the mixture according to their density and mass differences. Under the action of centrifugal force, heavier substances will be pushed to the outer wall of the centrifuge, while lighter substances will remain inside or in the center, thereby achieving the separation of substances. Compared with traditional centrifuges, self-cleaning centrifuges have the function of automatic cleaning, do not need to manually clean the centrifugal drum, and are more convenient to operate. Self-cleaning centrifuges can achieve efficient and fast separation operations and improve production efficiency.

United States market for Self-cleaning Centrifuge is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
