The global Self-crosslinking Polymer market size is predicted to grow from US\$ 3884 million in 2025 to US\$ 6118 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Self-crosslinking polymers are polymer systems that contain built-in reactive functional groups capable of forming crosslinks internally during or after film formation—without the need for added external crosslinkers—typically activated by heat, moisture, pH change, or ambient curing. Common chemistries include self-crosslinking acrylics (with N-methylol, glycidyl, carbamate, or keto-hydrazide groups), polyurethanes, and vinyl polymers, which are widely used in coatings, adhesives, inks, sealants, and textile finishes to improve durability, chemical resistance, and mechanical strength. The supply chain begins with upstream petrochemical feedstocks (ethylene, propylene, styrene, acrylic acid, methacrylates) and specialty functional monomers, followed by polymerization and functionalization by chemical manufacturers producing latexes or resins; these materials are then formulated by downstream compounders and coating/adhesive producers into finished products, which are distributed to end-use industries such as construction, automotive, packaging, furniture, textiles, and electronics through direct sales or specialty chemical distributors. In 2025, the global self-crosslinking polymer market produces about 1.35 million tons versus a capacity of 1.65 million tons, with average prices of USD 2,600–4,900 per ton and an average gross margin of 34%.

United States market for Self-crosslinking Polymer is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
